

GAME DESIGN DOCUMENT (GDD)

Game Title: Mordor High **Genre:** 3D Adventure / Stealth **Platform:** PC (Windows)

Developer: Mert Sungur

1. GAME CONCEPT & STORY

Story: The player controls a student trying to reach their school located in the harsh and dark terrains of Mordor. "The Eye of Sauron," positioned high above the terrain, constantly watches the student like a strict, disciplinary school principal. **Objective:** The player's main goal is to cross the volcanic landscape under the oppressive gaze of the Eye, sneak through the school entrance, and reach the "Graduation Sphere" located at the end of the interior corridor.

2. CORE MECHANICS

The game is built using core Unity engine systems:

- **Character Control (Character Controller):** Player movement is handled using the Character Controller component rather than physics-based Rigidbody, providing a sharper and more controlled experience. The character moves and rotates in Local Space using a "Tank Control" scheme.
- **Dynamic Animation System (Blend Tree):** The character's emotional state and movements are linked via an **Animator Blend Tree**. Based on player inputs, the character transitions smoothly between 4 different states: *Idle*, *Sad*, *Happy*, and *Dancing*.
- **Observer AI (Eye Tracking):** "The Eye of Sauron" (an imported FBX model) utilizes a custom C# script to track the player's Transform position every frame (Update method), ensuring the Eye is constantly looking at the character.
- **Win Condition (Trigger Event):** A target object (Graduation Sphere) is placed at the deepest point of the school's interior. This object has a Collider with the Is Trigger property enabled. When the character interacts with this sphere, the win state (a congratulatory console message) is triggered.

3. LEVEL & ENVIRONMENT DESIGN

A dark and oppressive theme was chosen to reflect the "Mordor" atmosphere:

- **Terrain:** Unity Terrain tools were used to sculpt the flat ground into volcanic obstacles, hills, and craters.
- **School Building (ProBuilder):** The school was modeled from scratch using the Unity ProBuilder tool. Utilizing a "Dollhouse/Diorama" perspective, both the exterior facade and the interior corridor/entrance were constructed. Dark stone and brick textures were applied to the surfaces.
- **Lighting:** The scene's Directional Light was dimmed and color-shifted to create a dark, crimson atmosphere. Red and orange Point Light components were added to the school's interior and the Eye's pupil to enhance the feeling of fire and lava.
